

Polymorphism

04/07/24

In Java:

```
Animal animal;  
  class      object  
animal = new Animal; → X
```

```
animal = new Lion; → ✓  
  class      constructor
```

- abstract method → function that doesn't have a program body, it's only the declaration of the prototype.
- abstract → general classes
- concrete → specific classes
- In an abstract class I can have abstract and concrete methods.
 ↓
 leave a class like a definition
 if I define something like 'abstract', this allows me to not initialize this class.
